

**North East and  
North Cumbria**

## **Integrated Care Board : Supplementary NENC variations**

**Prof Graham Evans**  
Executive Chief Digital and Information Officer/SIRO

# Striking Variations within NENC

For **diabetic admissions** to hospital there is very high variation in rates per diabetic. The **highest** areas of **North & South Tyneside, Hartlepool, and Stockton** have rates of 203-211 admissions per 10k diabetics. Whereas the **lowest** areas **Darlington** and **County Durham** have rates **half the** highest at 87-91 per 10k diabetics.

In **stage 1 bowel cancer** diagnosis **North Tyneside** (25.8% of diagnoses) is **much higher** than the next best County Durham (17.9% of diagnoses). It has **twice the proportion of North Cumbria** (12.0% of diagnoses) the **worst performing**, which does have a **third** (33.6%) with a **missing** diagnosis stage.

In the past five years in referrals to **Mental Health Services** for people **aged 0-18** years **Sunderland** and **South Tyneside** had a referral rates of **128** and **124 per 1,000**. On the North bank **North Tyneside** and **Newcastle Gateshead** were much lower at **90** and **73 per 1,000**.

**Hartlepool** has no **Smoking Cessation** service

# NENC vs England “Doing Better”

*Many of the questions leverage data from sources only available in NENC therefore comparable data at a national level isn't necessarily available, where it is accessible it has been used. For the relevant parts of this report these have been clearly marked.*

For NENC **measles, mumps, & rubella (MMR) vaccinations** 96.4% had a first dose **92.1% had both** doses aged 5 years. This is better than the **national** uptake of 93.5% first dose and **85.7% second dose**.

In **breast cancer screening** in women aged 53-70 the uptake in **NENC was 67.8%** compared to overall **England** uptake of **64.9%**.

In the seven **CQC patient experience** surveys published since 2020 only **one** result for one trust **was worse** than the nationally expected values, and **7** results **were better** than expected.

For **knee replacement** surgeries **three NENC providers** had **significantly better health gains** than the England average. These were North Tees & Hartlepool FT, Northumbria FT, and Nuffield Tees. No providers were significantly worse

# NENC vs England “Doing Worse”

The **incidence of colorectal cancer** in **NENC** is **68.8** per 100k people, which is higher than the overall **national** value of **63.3** per 100k.

People **not** living in the top 50 **most deprived** MSOAs in NENC (F 82.4 / M 78.6) are still expected to **live a year less** than people in **England** overall (F 83.2 / M 79.5)

*Many of the questions leverage data from sources only available in NENC therefore comparable data at a national level isn't necessarily available, where it is accessible it has been used. For the relevant parts of this report these have been clearly marked.*
